**Brief description:** The project involves design and development of an exosuit, a soft wearable robotic device, for upper limb augmentation. The work is interdisciplinary and brings together researchers from various disciplines including control, brain-machine interface, biomechanics, materials, machine learning, and human physiology. Your role will be estimation of trajectory/torque using EEG/EMG signal for the exosuit/exoskeleton control, and BCI system prototyping.

**Why you would like to join:** 1. This is a one-of-a-kind project in the country on EEG based control for exosuit/exoskeleton. 2. You will have an opportunity to interact with an interdisciplinary team of scientists having background as diverse as soft robotics, machine learning, biomechanics, signal processing and control theory.
